Rough draft trans. of "Fizika Metallov i Metallovedeniye (USSR) 1959, v. 7, no. 6, p. 880-884.

As a result of the action of ultrasonic vibration on a crystallizing fusion of Al-Si (from 2.5 to 20% of Si) there is a sharp diminution in primary grain size and microstructure. The yield strength increases on the average by 11%, and the relative elongation by 75%. A general increase in the hardness and impact viscosity of the alloys is noted. (Author)
